

ABSTRACT

According to the present invention, a first receiver interrupts live watching and listening to a television broadcast program. Thereafter, a second receiver installed in another place can continue watching and listening to the program from the interrupted point of the live watching and listening.

There is provided a digital video recorder server capable of communication between local and remote sets via a home network. When move watching and listening is manipulated on the local set, a built-in digital video recorder part starts recording a program in the process of live watching and listening so far. When receiving a command for shift watching and listening from the remote set thereafter, the local set reads the recorded program from the recording start point and delivers it to the remote set from a server part for time shift watching and listening to the program on the remote set.
